

# Tego™

Needlefree Haemodialysis Connector

Designed to help protect your patients' catheters from contamination and increased risk of catheter-related bloodstream infections during haemodialysis and apheresis applications.

Creates a closed system to help protect your patients' dialysis catheters from contamination and increased risk of catheter-related bloodstream infections.

Tego is a needle-free capping device, which closes the end of a catheter, creating a mechanically and microbiologically closed system when attached to the hub of a catheter. Tego is intended for use as an accessory to a vascular access device (catheter) used in haemodialysis and apheresis applications or as an accessory to an intravascular administration set for the administration or withdrawal of fluids to a patient through a cannula or needle placed in the vein or artery. Tego will permit access to the catheter without the use of needles, and therefore, passively aid in the reduction of needlestick injuries.

## Clinical Advantages

The Tego connector creates a mechanically and microbiologically closed system when attached to the hub of a catheter, eliminating open catheter hubs and help lower the potential for contamination and infection.

Tego's saline flush option is designed to help reduce the risk of Heparin Induced Thrombocytopenia (HIT).

Creating a closed system to help enhance patient safety.

## Tego Functional Attributes

- › Straight fluid path accommodates flow rates of greater than 600 mL/min
- › Remains in place during the entire haemodialysis treatment period
- › Validated for continuous patient use for up to seven days
- › Silicone seal remains closed when not activated, closing the fluid path and eliminating blood exposure

## Using Tego helps:

- › Reduce CRBSIs
- › Lower Costs

Proprietary needlefree technology that helps provides a safe and effective microbial barrier for haemodialysis and apheresis applications.
